SIEGENIA brings spaces to life.

Window systems
Door systems
Comfort systems

At home³
SIEGENIA is room comfort. Our products and solutions bring spaces to life and give people a sense of well-being.
comfort³
Prote
Windows and doors that provide maximum security:
That’s room comfort.

A house is a building, home a feeling. A sense of carefree protection, which can only arise where you feel safe. With SIEGENIA your house will surely become a home. ➊ With windows that, thanks to the best burglar resistance, don’t give burglars a chance. ➋ With doors whose massive bolts and hooks lock automatically when pulled shut. ➌ Or with electronic window and door surveillance that lets you have everything securely in view via app.
The new ease of living is our drive. This added quality of life can have many faces, ranging from small comfort details that make everyday hand movements easier up to smart home solutions for smarter living. We ensure this with windows and doors that can be operated intuitively and smoothly. With invisible motorised drives that open and close windows and doors by themselves. Or with our home automation that intelligently links windows, doors and ventilation systems.

Windows and doors that open and close themselves: That's room comfort.
Sun
With natural light and a healthy indoor environment for deep relaxation: That's room comfort.

Leave the noise of everyday life outside, let in fresh air and sunshine: That's quality of life from room comfort. SIEGENIA creates this quality ➊ with large surface windows that appear light due to their narrow frames and ➋ thanks to their outstanding airtightness are highly energy-efficient. ➌ Or with our ventilators that are energy efficient and whisper quiet to ensure a healthy indoor environment of your private wellness oasis.
Not we should adapt to rooms – they should fit us. Like a favourite piece of clothing: Comfortable and familiar. When the requirements of the space are in harmony with our need for well-being, room comfort then creates quality of life.
Window systems

- Burglar resistance and monitoring
- Modern window design and motorised drives
- Universal ease of use
- Smooth running, operating safety and durability
- Demand-based ventilation

Door systems

- Sliding doors
  - Special ease of use for all opening types
  - Universal ease of use, floor-length glazing
  - Burglar resistance and monitoring
  - Thermal insulation and compression

- Entrance doors
  - Burglar resistance and monitoring
  - Automatic locking and app control
  - Concealed technology

Comfort systems

- Control and monitoring of windows, doors and ventilators
- Demand-based ventilation, window and wall-mounted ventilators
In terms of building physics, a window is a hole in the outer shell of a building. Only the window hardware functions create room comfort: Security through burglary resistance, a perfect indoor environment through integrated ventilation, aesthetics through narrow frame profiles and elegant handles, smooth operation and durable operation through the highest quality materials.
Security

Large surface windows are nice to look out of. But unfortunately also to enter into. Security therefore is a top priority with our window hardware: From specially shaped bolts, which prevent these from being pried open, up to the highest security, for example, resistance class RC3. Our robust locking systems can be easily operated, and as simply and reliably monitored electronically as well: for example, with your smartphone.

Comfort

Can room comfort be heard? Thanks to the integrated sash lifter and optimum adjustment possibilities, windows equipped with SIEGENIA hardware slide as gently into their frames as the doors of a luxury saloon car. Can room comfort be felt? The handles and gears of our hardware can be flexibly installed in the frame. For example, lower - for people in wheelchairs. Can room comfort be seen? Windows and doors open and close themselves thanks to concealed drives. You can see: Room comfort can be enjoyed with all your senses.

Indoor environment

More light and air, more zest for life. Windows inspire the soul and improve your living atmosphere. But besides natural daylight and oxygen-rich air, a healthy dose of energy efficiency makes for a perfect indoor environment. The balancing act between a continuous supply of fresh air and sealed windows can best be created with our ventilation units. Almost invisibly integrated in or on the window, they provide the necessary air exchange and keep any street noise outside. Even heat recovery and pollen filtration are easily achievable. Room comfort to breathe in.
Window systems for timber, PVC and aluminium
Well-being begins with security.

Effective protection against prying your windows open.

Anti-intruder protection up to RC3
In order to protect your home as best as possible, different security levels are necessary depending on the accessibility of the window. The greater the number and quality of locking points the better! Our mushroom-shaped bolts and frame parts made of special steel have proved their worth millions of times over. They even make life difficult for experienced burglars, without compromises in terms of smooth running and design.

A question of quality
With its automatic height adjustment and roll function, our comfort mushroom cam continuously slides easily and precisely into the frame part, where it securely interlocks. That’s something only SIEGENIA offers.
Resistance class RC2
The windows offer effective resistance for up to 3 minutes against screwdrivers, pliers and wedges.

Resistance class RC3
The windows also withstand burglary attempts with heavy tools like crowbars for up to 5 minutes.

Every minute counts
After two to three minutes, most perpetrators abort their burglary attempt. That’s why the police recommended at least resistance class RC2 for easily accessible windows. A window with RC1 only provides basic protection against physical violence and vandalism.
Window systems
Optimal intruder protection and clever surveillance.

Double security inside and out.

Lockable handles
Key locked windows protect against burglary attempts whereby the perpetrator smashes a small hole into the glass pane or glass seal in order to open the window with the handle. Moreover, locked windows can be tilted from the inside, but only completely opened with the key.

Ensure fresh air in a burglar proof way.

Secured night vent
High intruder protection and healthy ventilation are no longer a contradiction in terms. Because with our secured gap ventilation night vent, TITAN vent secure, you can leave your window open a crack and still be well protected – against burglary, against drafts and driving rain. This way, a pleasant feel-good climate is ensured regardless of the user. In combination with a motorised drive, secured ventilation is also possible automatically.

For timber and PVC windows.
Simply control motorised windows via app.

SIEGENIA Comfort
The user-friendly app solution SIEGENIA Comfort lets you monitor or control the opening and locking status of your motorised windows in the smart version easily and reliably via your smartphone.

Integrate VdS tested windows in alarm systems.

AEROCONTROL
Secure your windows and sliding doors electronically as well: Using the VdS tested magnetic switch. These reliably report any tampering with the window by burglars to your burglar alarm system.

Senso secure wireless window sensor
With the SIEGENIA Comfort app and our concealed, integrable wireless window sensors, you can see at a glance whether your windows are locked correctly.
Window systems
More comfort in a perfect design.

The window design for modern room concepts.

Concealed pivots
If your room and decorating ideas follow a clear line, then they can be optimally supported by axxent hardware. This way, you can achieve a window design where all the components are hidden in the frame and the pivots are "invisible." Only axxent combines least wear with highest design and comfort requirements and offers the best prospects for perfectly shaped beautiful timber, PVC or aluminium windows.

Design handle GLOBE
Style and aesthetics in an ergonomic design: With its sweeping teardrop shape, it not only looks good, it also feels good in your hand. The GLOBE window handle is available in many colours and rounds off a clear window design in a particularly coherent manner.
Sliding and locking at the push of a button by our invisible drives.

Motorised drives
Powerful, hidden integrated motor functions brings greater ease into life. Because especially hard to reach windows can thus be easily operated at the touch of a button and also integrated into the building automation. DRIVE axxent drives provide controlled ventilation fully automatically and are almost invisible from the outside.

SIEGENIA Comfort App
Use your smartphone or tablet as the remote control for your motor driven windows and wall or window ventilators. All the additional benefits of the SIEGENIA Comfort app are described on page 48.
Window systems
Often it's the details that make life easier.

COMFORT & BARRIER-FREE ACCESSIBILITY

Barrier-free transitions for boundless freedom of movement.

Floor-level thresholds
Modern balcony and patio doors should give you light and space – and not pose a tripping hazard. That's why our systems for French doors are also available with a floor-level threshold. This provides accessible solutions for people with physical limitations as well as for senior living in a perfect design that ensures increased quality of life and greater independence.
More comfort in reach: Easily accessible handles.

Low handle positions
Window with a future are windows that anyone can operate. For example, using lower handles that are also easy to reach for people in wheelchairs.

Minimum operating force when tilting and locking.

Z top stay
Once you operate a window with positive control, you will develop a weakness for maximum comfort. Turning the handle tilts or closes the sash and minimizes the effort required.

Operate two window sashes using a single handle.

Automatic shoot bolt
This solution can be used for double sash windows to operate the upper lock in the inactive sash using the window handle.

For timber and PVC windows.
Window systems
Only these comfort features will allow you to make a window your window.

**Permanently easy closing without friction and wear.**

**Sash lifter**
It cannot defy gravity, but it can successfully counteract it: our sash lifter. Wide window sashes in particular sink a bit over time. That’s why they lift the sash imperceptibly a bit each time you close it so that they still slide safely and gently into the frame even after years of use.

**Individual opening width.**

**Opening restrictor with braking function**
The sash is uniformly braked when opening and closing to avoid hard stops and increase the service life of the window. This way, the window remains in the desired turning position and does not open or close shut even with drafts.

**Safe protection against improper operation.**

**Mishandling device**
Make your windows particularly safe to operate. Equipped with a mishandling device, you can exclude the risk of faulty switching. Because with a hasty change from the turn to the tilt position the window handle is specifically blocked.
Protection against opening balcony and patio doors.

Snappers
This clever component keeps your patio or balcony doors securely in the frame merely by pressing them shut. This way, they cannot open up when unlocked after a sudden gust of wind.

For timber and PVC windows.

Appealing design for the perfect use of space.

Sliding hardware for windows and doors
There is no loss of interior space thanks to the sliding sash and the tedious moving of objects to ventilate can be avoided. The continuous sealing system ensures a high level of energy efficiency. Owners of houses and apartments do not need to dispense with a well protected home: Massive locking hooks effectively get rid of thieves.

For aluminium, timber and PVC windows.
Window systems
Room comfort to breathe in.

More comfortable tilt ventilation thanks to a flexible opening width

Adjustable tilt opening width
The energy saving stay lets you easily adjust the amount of incoming air to the respective outside temperature window when venting windows. One quick movement of the hand can thus minimise drafts and easily regulate the indoor environment. And without any tools.

Ventilating when specifically needed automatically and quietly.

Intelligent window ventilators
An all-round healthy indoor environment improves your well-being. Demand-controlled ventilation plays a central role here. Our AERO window ventilators offer particularly versatile solutions that work regardless of their user and can be integrated almost invisibly in and around the window. Their capabilities range from effective sound absorption up to pollen filtration and heat recovery.

You can find our energy-efficient ventilators with heat recovery and many other additional functions starting on page 52.
The question is not: Who’s at the door? The question is: What’s in the door? Equipped with modern multi-point locks and intelligent access control systems, modern doors open up a high degree of security and ease of use.
Security

The calming effect of particularly secure entrance doors and sliding doors is subjective. But their burglar resistant properties can be measured objectively. Burglars love it fast and easy. Multiple locking points, in contrast, frighten them in several ways. It takes too much time and it makes too much noise to overcome them. Even then the chances of success are still vanishingly small: therefore, room comfort can also be something that doesn't come into the house in the first place and gives us a feeling of security.

Comfort

When solid steel bolts and hook bolts interlock in the frame to ensure maximum security, that sounds like hard work. However, the ease with which our locking systems lock never fails to amaze and, upon request, also works automatically: With sliding doors, for example, via app and, with your front door, simply by pulling it shut. And when the app identifies you via Bluetooth and subsequently opens it keyless for you, then you will notice that room comfort already begins at the door.

Design

In modern interior design, less is often more. SIEGENIA offers you plenty of opportunities to make important comfort and safety technology invisible from the outside. Tucked away in the frame or the profile, this results in clear design advantages. Even with large sliding doors, less brings you more: With slender sash profiles and glazing that merges seamlessly into the floor, you increase the glass content and, with the increased daylight, bring more room comfort into your home.
Door systems: Sliding doors made from timber, PVC and aluminium
The true size of a room is measured not in square meters, but in apparent spaciousness and natural daylight.

Take advantage of your creative freedom for nicer and brighter living.

More opening width and versions
Would you like to bring your garden indoors on warm days? Or connect your patio to your living room during an extended Sunday brunch? Then why not give your sliding door the necessary opening width. With PORTAL this can be up to 12 m and a simple movement of the hand or push of a button is enough to dissolve any boundaries between the inside and outside "into thin air."

Due to the free choice of opening types, you can configure your sliding door to perfectly match your room situation. All versions ensure maximum ease of use – namely in every weight class.

Parallel Tilt & Slide systems are not only easy to slide, they also permit tilt ventilation.

Fold & Slide systems can be easily folded inward or outward and provide unrestricted opening widths of up to 6.3 m. The threshold can be used barrier-free.
Lift & Slide systems provide opening widths up to 12 m at a total width of over 19 m. Even heavyweights can be operated absolutely smoothly and securely. Moreover, our lift-slide systems open up optimum design possibilities for special room comfort in terms of operation, barrier-free accessibility and design.
Door systems: Sliding doors
With feather-light operation like a modern kitchen drawer.
Close particularly gentle and secure.

SOFT CLOSE function
There is a safe solution for the simple operation of large and heavy lift-slide systems: The innovative SOFT CLOSE function that can be invisibly integrated into the sash. This brakes the sash gently just before the end position and then pulls it shut automatically. This minimises any risk of injury in the case of improper operation and precludes any material damage.

Minimum operating force, maximum ease of use.

Clever comfort solutions
There is always a magic word for maximum ease of use. When it comes to lift-slide systems, this is "energy storage". A special spring hidden in the comfort gear uses the weight of the sash to lift it even more easily: With larger parallel slide & tilt doors, "positive control" is critical: Merely turning the handle moves the sash conveniently into the desired position.

Set heavy things very easily in motion.

Innovative bogie wheels
Sophisticated product details and the highest quality materials allow sliding doors of all sizes to slide back and forth almost weightlessly. This is achieved by very special bogie wheels which distribute the load of the sash across eight rollers.
Door systems: Sliding doors
The most elegant solution to dissolve barriers into thin air.

Barrier-free solutions for a carefree life.

Floor-level threshold ECO PASS SKY for Lift & Slide systems
With a height of 0 mm, the ECO PASS axxent threshold for timber-aluminium sliding doors clears the way for barrier-free living. For other sliding doors, the convenient passage height is only 5 mm. Both threshold versions provide more independence in old age and for those with physical limitations, and also offer comfort-conscious people an improved quality of life.

For sliding doors made of timber-aluminium, timber and PVC. We also offer barrier-free solutions for fold & slide systems.

Opening and closing at the press of a button.

Motorised SIEGENIA DRIVE drives
Why don't you raise ease of use to the highest level by opening or closing and locking your sliding door shut completely automatically. Even programming specific opening widths or an automatic timer is child's play. Many components are fully concealed in the DRIVE axxent version.

With the SIEGENIA Comfort app, you can also conveniently operate your sliding door via smartphone or tablet. All additional information can be found on page 48.
**Glazing down to the threshold level for a particularly clear design.**

**ECO PASS SKY for Lift & Slide systems**
Opt for a design solution that optimally supports a bright and cheerful room atmosphere. The seamless transition of the glass elements to the floor and the narrower sash profiles removes the boundary between the inside and outside and makes your living space appear larger. When the sash is open, the minimum threshold height provides absolute barrier-free accessibility.

For sliding doors made of timber-aluminium and timber.
Door systems: Sliding doors
Live securely without bounds.

Anti-intruder protection on a grand scale for your sliding doors.

Anti-intruder protection up to RC2
Patio doors in particular offer burglars large surfaces that are open to attack and often a good visual cover because of hedges or fences. Play it safe and protect yourself with modern SIEGENIA security hardware that ensure high burglar resistance. Operation remains absolutely smooth.

Robust locking elements.
Special locking hooks, locking bolts or locking cams make it difficult to pry open the sash. Thus even the basic configuration will ensure a level of basic security that is also ensured for the night vent. For the resistance class RC2, the number of locking elements is adapted to the requirements and striker plates made of special steel are used.

Resistance class RC1
For hard to access sliding doors. Basic protection against break in attempts with physical violence and vandalism.

Resistance class RC2
Recommended by the CID. Additional protection against simple tools like screwdrivers.
In terms of security, everything under control.

Lockable handles and drives
These not only makes prying these open difficult, but also burglary attempts where the perpetrator smash a small hole into the glass pane or glass seal in order to open the sliding door with the handle.

Integration into alarm systems: VdS tested up to Class C.

AEROCONTROL
To support mechanical burglar resistance, you can also monitor our sliding doors electronically. Hidden integrated magnetic switches report any undetected security risks of open or poorly locked sliding elements to your central monitoring or alarm system.

Very simply more control: Monitoring per app.

SIEGENIA Comfort app
The user-friendly app solution SIEGENIA Comfort allows you to monitor and control the opening and locking status of your motorised sliding doors easily and reliably via your smartphone. All statuses can be indicated at a glance and you can also use attractive, additional features.
Door systems: Sliding doors
Don't scrimp on room comfort, but with your heating costs.

Optimal thermal insulation
for Lift & Slide systems.

ECO PASS threshold
The barrier-free ECO PASS threshold liberates you from excessive heating costs. Because under the flat threshold lies a well-designed 10-chamber profile with excellent insulation properties. It therefore has very good thermal insulating properties and provides you with the ideal prerequisites to save plenty of energy. The danger of condensation is significantly reduced as well. Barrier-free accessibility, design and energy efficiency perfectly interconnected: That's room comfort.

For sliding doors made of timber-aluminium, timber and PVC.

Saving energy because of high compression.

Passive house compatible solutions
Airtightness the name of the game for low thermal transmittance values. That's why our door systems feature numerous special solutions. In the lift-slide field, this not only involves the clever threshold but also the thermally separated sealing rail used on two sash sides. With their high contact pressure, our locking systems also play an important role in saving energy comfortably and securely.
Door systems: Entrance doors
Protection starts at your door.

Doors with multiple security features:
The nightmare for any burglar.

KFV multi-point locks
Poorly secured house or apartment doors are more popular than ever with burglars. In contrast, doors with KFV multi-point locks are a nightmare. Because additional locking points above and below the main lock extends their burglar resistance across the entire height of the door. This will put a stop to any burglars many times over. Specifically: massive steel pins, clawing hook bolts or the perfect combination of both. Prying these open is nearly impossible!

Multiple protected locking is easily done from the main lock. Or, with our automatic locking systems, already done simply by pulling the door shut.

Anti-intruder protection up to RC4
The police recommended at least resistance class RC2 for entrance doors. With the quality brand SIEGENIA KFV, solutions up to RC4 and VdS-class C are easily possible. All with one goal: Stealing time from the burglar. Because after two to three minutes almost every perpetrator gives up his attempt.
Resistance class RC2
The doors offer effective resistance for up to 3 minutes against screwdrivers, pliers and wedges.

Resistance class RC3
The windows also withstand burglary attempts with heavy tools like crowbars for up to 5 minutes.

Resistance class RC4
Additional protection against sawing and impact tools as well as a cordless drill.
**Door systems: Entrance doors**
Highest intrusion protection through intelligent doors.

**Rely on your fingerprint.**

**KFV Fingerprint scanner**
The human need for security is as individual as a fingerprint. This is not only unique, you always have it at hand. What could be better than using your fingertip as your personal security key? Because this is by nature already superior to conventional keys, cards and codes.

**Integrate VdS tested entrance doors in alarm systems.**

**Bolt switch contact**
You want to connect your entrance door with an alarm or surveillance device? Then the KFV bolt switch contact is the optimal solution for you. The system reliably controls the opening and locking status of the door. It is invisible from the outside, certified to VdS class C and can be used in all KFV multi-point locks with a hook bolt.
Additional protection when opening the door.

Door arrester
You don't have to immediately open your door completely to every stranger. You can also open it only a crack in the secured state: Our integrated locking lever can be easily activated by swivel knob and unlocked only by authorised persons from the outside via the main lock.
Door systems: Entrance doors
At the door you can already feel that it's your home.

SECURITY & COMFORT

That's how convenient burglar proof is:
keyless ease of use.

Automatic function
Are you tired of always having to look for your key at your own front door? And, barely with your foot out the door, having to think about locking it again? If so, then an automatic multi-point locking system is the right solution for you.

Whether quickly and conveniently by remote control, with your mobile phone or fingerprint: Enjoy the convenience of unlocking your door completely automatically. In combination with a motorised door drive, it will even open itself automatically for you.

As soon as you pull your door into the lock, it will lock itself securely behind you. This way, the burglar resistant properties of our multi-point lock come into full effect whenever you want.

Multi-point locking systems with an automatic function offer numerous control options:

- Via the secure, electronic access control systems
  - Fingerscanner: Area sensor with touch ID
  - Keypad: Equipped with a one-off and holiday PIN function
  - Transponder: Also supports SFID cards

- Via the Bluetooth function of your mobile telephone and the SIEGENIA Comfort app

- Via your intercom
Door systems: Entrance doors and interior doors
Robust technology in a sleek design.
For sure a perfect design.

Concealed door hinges
Do you love a timeless, elegant design? Then our axxent door hinge opens up new possibilities for aluminium doors. Because here the door hinges are completely concealed inside the aluminium profile and thus completely invisible when the door is closed. The axxent door hinge combines the highest design standards with robust technology.

Exceptionally beautiful interior doors.

Magnetic lock
Provide clear aesthetics without corners and edges: With the KFV magnetic lock, the latch lies flush in alignment with the gear box when the door is open. It is pulled into the frame part by special magnets only when the door is closed and thus remains virtually invisible.

Whisper quiet locking without maintenance.

Soft lock latch
Not only can modern locking convenience be felt – it is also a matter of acoustics and, ideally, absolutely maintenance-free. With our soft lock latch, you can at best hear a quiet clicking noise when closing the door. To this end the main lock latch is equipped with an abrasion-resistant plastic sheath.
Three dimensions and four walls result in a space. But still no living space. Because it is a dynamic construction made up of many factors and features. To link these intelligently, that’s room comfort.
Ventilation and energy efficiency

Today, modern building envelopes are – thanks to our window and door hardware - so tight that ventilation has taken on a new importance. Its primary focus is on health, on breathing clean, dust and pollen free fresh air. But proper ventilation is also crucial in retaining the value of the property to prevent mould growth for example. With intelligent window ventilators, which can be integrated in and on the window virtually invisibly, powerful wall-mounted ventilators or motorised window drives permit user-independent and demand-controlled ventilation. This way, SIEGENIA creates room comfort you can breathe.

Smart Home

The smartphone and tablet will be the central control elements of modern living in the future. A future that SIEGENIA is helping to shape. Doors, windows and ventilators can now be controlled and managed by our solutions. And soon you will be able to operate even many more room comfort functions with just a single tap of your finger.
Comfort systems
The new ease of living.

SMART HOME

App control:
Your smartphone becomes a remote control.

SIEGENIA Comfort App
Sometimes, we just want to find a cozy place in the house and relax. But no sooner have you hit the couch do you suddenly notice the stuffy air in the room or that someone’s ringing the door bell. You could just sit back and simply pick up your smartphone, because many things can now be quite easily taken care of via an app. With the SIEGENIA Comfort app, you have your SIEGENIA systems at home within easy reach anytime and can now optimally operate these over Wi-Fi with your smartphone or tablet. You will be surprised how easy it is.
Control via intelligent sensors: Ventilate automatically demand-controlled.

SENSOAIR
Imagine a home where you no longer have to think about ventilation every day, but always have good indoor air. This added room comfort is generated by clever networking. You can, for example, connect our air quality sensor SENSOAIR to a motorised ventilator like AEROPAC. Without much effort you can thus create a ventilation system that ventilates intelligently and demand-controlled. Spent and bad air (VOC) is immediately detected to automatically improve the quality of your indoor air through controlled air exchange.

The intelligent air quality sensor for activating window and wall-mounted ventilators.
Comfort systems
There are certainly more attractive burglary targets than a home with intelligent security technology.

App monitoring:
A secure eye on everything at all times.

SIEGENIA Comfort
When windows or doors stand open unnoticed, burglar-proof hardware is useless. With the SIEGENIA Comfort app, a quick glance at your smartphone is enough to control their opening status. This functions with all motorised SIEGENIA solutions or in combination with the wireless window sensors, and of course, not only can you check the status, you can also lock windows and doors via smartphone, making doing your rounds superfluous.
Integration into surveillance systems and building automation.

AEROCONTROL
With AEROCONTROL, you integrate your windows and sliding doors into a central monitoring or alarm system. Thanks to reliable technology, you can, depending on the version, not only control the opening state, but proper locking as well – for security solutions up to VdS class C.

When it comes to saving energy, too, AEROCONTROL supports you by automatically closing the thermostat valves on your radiators when a window is open. This avoids unnecessary heat loss, saves money and protects the environment.
Comfort systems
How you ventilate is how you live.

Intelligent ventilation:
Quietly and efficiently ensure healthy fresh air.

Protection against mould and moisture damage
Well controlled, healthy indoor air is not only good for your personal well-being, it also protects the structure of your own four walls – against moisture and mould. To achieve this, tight building envelopes require sufficient air exchange several times a day. But with intelligent window and wall-mounted ventilators you don’t have to do that yourself but can let your windows and walls “breathe” for your home.

Protection against noise and air pollution
Your home can offer you the chance to enjoy fresh and clean air without letting road or rail traffic acoustically into the house when ventilating. Where conventional window ventilation reaches its limits, upscale comfort and convenience begins with AERO ventilation systems. It boasts a reassuringly high sound insulation which ensures a relaxed room atmosphere and a restful night’s sleep. They also employ clever filter technology which lets pollen and fine dust allergy sufferers breathe easier.

About 10 litres of water vapour accumulate daily in a four-person household:

A mere 10 dB increase in nighttime noise pollution is perceived as a doubling and increases the risk of cardiovascular disease by 50%.
After a burglary, 46% of victims report feeling insecure in their normal environment over a long period of time.

Our ventilators with heat recovery have a heat recovery rate of up to 73%. This noticeably reduces your heating costs – and saves money.

The solution for greater energy efficiency
In order to noticeably save energy, a high degree of thermal insulation is important – but that’s only the beginning. Because with the help of modern ventilation units, you can also avoid directly forfeiting that saved heating energy again when opening the window. Our energy-efficient ventilation systems not only offer you air throughput that can be flexibly adapted to your daily demand, but, depending on the model, also open up to the opportunity for heat recovery as well.

Secure ventilation with the window closed
The ability to ventilate with the windows closed not only reduces your expenses but also your burglary risk. So you can confidently provide fresh air even when you’re away. Because whether opened or tilted: Unlocked windows can be defeated in seconds. That’s how every burglar sees it and your insurance company therefore as well.

73%

46%

Comfort systems
The key to greater room comfort lies in your air.

VENTILATION & ENERGY EFFICIENCY

Ventilators in or on your window:
perfectly integratable service packages.

Ventilator-driven window ventilator
Our high quality window ventilators can be integrated flexibly and almost invisibly around your windows and ensure an all-around healthy room air atmosphere. In doing so, their performance capabilities extend far beyond mere ventilation. Depending on the model, clever air filters and an automatic humidity and CO₂ control are also included. For example with the AEROMAT VT with heat recovery, which transfers the heat from the spent indoor air onto the incoming fresh air thereby nicely preheating it. The oxygen content remains high – your energy costs are reduced. This way, you do not save on the quality of your indoor air, but on your heating costs.

Ventilation from the natural pressure differential
You can also create a healthy and sound-insulated room atmosphere with our compact passive ventilators. These use the natural pressure differential between the outside air and spent indoor air to regulate the exchange of air. Whether with the AEROMAT mini, which is almost completely concealed in window rebate, or the AEROMAT midi HY, which is built into the frame and/or the sash and combines high air throughput with an integrated humidity control: The look is modern discreet, installation is especially flexible and the fresh air supply is naturally demand-controlled.
Wall and tube mounted ventilators: modernisation friendly all-rounders.

**Powerful wall-mounted ventilators**
Particularly in renovations, there is a lot to be said for using high performance wall-mounted ventilators. Its installation, operation and maintenance? Distinctly simple. Its air throughput, filtering action and sound absorption? Exceptionally high. It is therefore no accident that our AEROPAC has proven its worth in more than 100,000 cases against increasing noise and environmental pollution. And thus a great deal more often lies behind a clear design: With our AEROVITAL ambience, for example, it is the ability to not only react to your smartphone but also, thanks to its integrated air quality sensors, automatically to your requirements as well.

**Intelligent pipe wall ventilators**
Little effort, big impact: In the “category” of modern pipe wall ventilators, AEROTUBE sets the tone. All of its technology is in the wall, more specifically: hidden in the tube. As a demand-controlled exhaust and air supply unit with integrated heat recovery, AEROTUBE is generally used in pairs. Its special feature: The devices communicate not only with your smartphone, but also with each other via Wi-Fi, which significantly simplifies wiring.
